

PRD: SyncPoint – Enterprise GTM Orchestrator

Version: 1.1
Status: Draft / Portfolio Concept
Line Spacing: 1.25

1. Executive Summary

SyncPoint is a specialized internal coordination platform designed to bridge the operational gap between Product Engineering and Go-To-Market (GTM) teams. In high-growth enterprise SaaS environments, features often "leak" into production without marketing readiness, or campaigns launch for features that are delayed. SyncPoint synchronizes these two distinct workflows into a single, automated source of truth.

2. The Problem Statement

- **Information Asymmetry:** Marketing teams rely on manual Slack check-ins to know when a feature is "ready" for screenshots or promotion.
- **Tooling Fragmentation:** Engineering lives in Jira/Linear (technical tasks); Marketing lives in Asana/Notion (creative tasks). Neither has visibility into the other's "readiness."
- **Launch Friction:** Late-stage technical pivots often fail to reach the GTM team, resulting in inaccurate customer-facing documentation.

3. User Personas & Pain Points

Persona	Primary Goal	Critical Friction
The Product Manager (PM)	Ship stable features & manage roadmap.	Spending 20% of the week answering status queries from non-technical teams.
Product Marketer (PMM)	Create accurate campaigns & enablement.	Lack of access to stable "staging" environments for asset creation.
The Engineer	Focus on code quality and deployment.	Marketing "jumping the gun" on announcements before the build is verified.

4. Functional Requirements

4.1 Live Roadmap Synchronization

- **Auto-Sync:** Pulls real-time ticket status from Engineering tools (e.g., Jira) and maps technical "Done" to GTM "Ready."
- **Environment Badges:** Clear visual indicators of where a feature currently resides: Local, Staging, Canary, or Production.

4.2 The Dependency Engine

- **Blocking Logic:** Allows GTM leads to set "Hard Blocks." (Example: Marketing Email cannot be sent until "Legal Review" and "QA Verification" are both checked).
- **Conflict Alerts:** Automated system warnings if a campaign date is set before the projected technical deployment date.

4.3 AI Knowledge Extraction (The "Bridge")

- **Spec Parsing:** AI summarizes complex technical PRDs into 3-5 bullet points of "User Value" for the marketing team.
- **Asset Generator:** Automatically creates a list of suggested screenshots or video walkthroughs based on the modified UI components in the code commit.

5. User Stories

Strategic Alignment

- **As a Product Marketer,** I want to see a unified timeline of technical milestones so I can plan my 30-day campaign calendar without manual status updates.
- **As a PM,** I want to set a "Freeze Date" for UI changes so that Marketing can take final screenshots without the design shifting under them.

Operational Execution

- **As a Content Creator,** I want to receive an automated notification the moment a feature is deployed to the Staging environment so I can record demo videos.
- **As a Marketing Lead,** I want to see a "Readiness Score" for an upcoming launch that combines Engineering progress and Marketing asset completion.

6. Design & UX Principles

- **Density vs. Clarity:** Use a "Progressive Disclosure" pattern to show high-level status first, with technical logs available on drill-down.
- **Trust over Automation:** AI-generated summaries must always be "Draft Status" until a human PM reviews and promotes them to "Approved Copy."
- **Visual Urgency:** Use a color-coded system (Green/Yellow/Red) to highlight launches that

are at risk due to cross-functional dependencies.
